

AI SURVEILLANCE CAR

ESP32- Powered | YOLO Detection | Autonomous Navigation

WHAT IS THE AI SURVEILLANCE CAR?

The AI Surveillance Car is a small 2-wheel robot designed for smart monitoring. It uses a camera and YOLO-based AI to detect people and objects in real time. When a person is detected, the car stops. If the path is clear, it moves forward automatically.

This makes it useful for indoor security and autonomous surveillance.

HOW THE AI WORKS

Step 1: Camera — Captures live video feed in real time

Step 2: Image Processing — Camera processes each frame

Step 3: YOLO Detection — Identifies persons or objects in frame

Step 4: Decision — Person detected = STOP | Clear path = MOVE FORWARD

USES OF THE CAR

- Security patrol in risky areas
- Monitoring restricted areas
- Indoor building surveillance
- Detecting people and objects using AI
- Manual control when needed

FUTURE IMPROVEMENTS & IMPACT

- Night vision
- Obstacle avoidance
- Automatic alerts
- Video recording
- Fully autonomous movement
- Use in larger security areas

THANK YOU...
